

Hotsec backup utility manual

V1.6.0.17

Hotsec backup utility is included in the Hotsec database setup package.

Using the utility is better than just copy the hotsec.fdb file. It keeps all the active connections to the database so no data will be lost.

By default the backup task „Hotsec“ is already there, click to make it active.

Server name or ip: define the server location. By default it is localhost or 127.0.0.1 change this if your Hotsec server is located in different location. Still it is recommended that the backup utility will be launched in the same machine with server.

Database file, User name and password are by default, if you haven't change them during Hotsec installation you don't need to change them here.

Backup repository: the location of backup file.

Send error notification e-mail: check this if you want to receive error message when the backup has failed. For e-mail you should also define your **SMTP server** and **E-Mail address** which will display in „from“ field when receiving an e-mail.

Restore test: after backup the utility will check if the database can be restored.

Create scheduled task button will open Windows scheduled tasks manager where you can create scheduled task for Hotsec backup.

Restore backup restores Hotsec database from backup

Create backup will force to make backup when the button is pressed.
